

## Low power quad op amps

## LM124/224/324/324A/ SA534/LM2902

### DESCRIPTION

The LM124/SA534/LM2902 series consists of four independent, high-gain, internally frequency-compensated operational amplifiers designed specifically to operate from a single power supply over a wide range of voltages.

### UNIQUE FEATURES

In the linear mode, the input common-mode voltage range includes ground and the output voltage can also swing to ground, even though operated from only a single power supply voltage.

The unity gain crossover frequency and the input bias current are temperature-compensated.

### FEATURES

- Internally frequency-compensated for unity gain
- Large DC voltage gain: 100dB
- Wide bandwidth (unity gain): 1MHz (temperature-compensated)
- Wide power supply range Single supply:  $3V_{DC}$  to  $30V_{DC}$  or dual supplies:  $\pm 1.5V_{DC}$  to  $\pm 15V_{DC}$
- Very low supply current drain: essentially independent of supply voltage (1mW/op amp at  $+5V_{DC}$ )
- Low input biasing current:  $45nA_{DC}$  (temperature-compensated)
- Low input offset voltage:  $2mV_{DC}$  and offset current:  $5nA_{DC}$
- Differential input voltage range equal to the power supply voltage
- Large output voltage:  $0V_{DC}$  to  $V_{CC}-1.5V_{DC}$  swing

### PIN CONFIGURATION

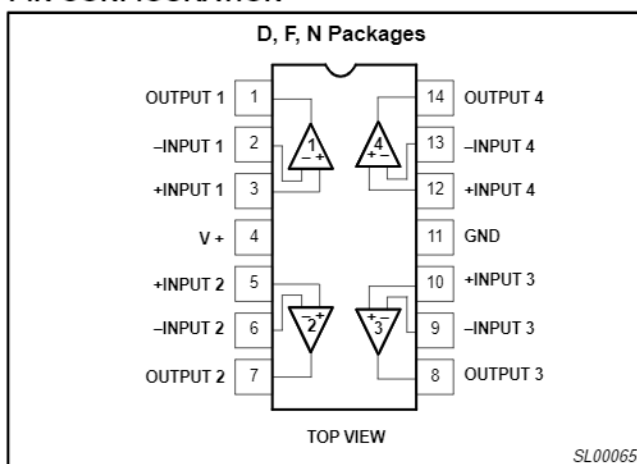

Figure 1. Pin Configuration

### ORDERING INFORMATION

DESCRIPTION	TEMPERATURE RANGE	ORDER CODE	DWG #
14-Pin Plastic Dual In-Line Package (DIP)	-55°C to +125°C	LM124N	SOT27-1
14-Pin Ceramic Dual In-Line Package (CERDIP)	-55°C to +125°C	LM124F	0581B
14-Pin Plastic Dual In-Line Package (DIP)	-25°C to +85°C	LM224N	SOT27-1
14-Pin Ceramic Dual In-Line Package (CERDIP)	-25°C to +85°C	LM224F	0581B
14-Pin Plastic Small Outline (SO) Package	-25°C to +85°C	LM224D	SOT108-1
14-Pin Plastic Dual In-Line Package (DIP)	0°C to +70°C	LM324N	SOT27-1
14-Pin Ceramic Dual In-Line Package (CERDIP)	0°C to +70°C	LM324F	0581B
14-Pin Plastic Small Outline (SO) Package	0°C to +70°C	LM324D	SOT108-1
14-Pin Plastic Dual In-Line Package (DIP)	0°C to +70°C	LM324AN	SOT27-1
14-Pin Plastic Small Outline (SO) Package	0°C to +70°C	LM324AD	SOT108-1
14-Pin Plastic Dual In-Line Package (DIP)	-40°C to +85°C	SA534N	SOT27-1
14-Pin Ceramic Dual In-Line Package (CERDIP)	-40°C to +85°C	SA534F	0581B
14-Pin Plastic Small Outline (SO) Package	-40°C to +85°C	SA534D	SOT108-1
14-Pin Plastic Small Outline (SO) Package	-40°C to +125°C	LM2902D	SOT108-1
14-Pin Plastic Dual In-Line Package (DIP)	-40°C to +125°C	LM2902N	SOT27-1

## ABSOLUTE MAXIMUM RATINGS

SYMBOL	PARAMETER	RATING	UNIT
$V_{CC}$	Supply voltage	32 or $\pm 16$	$V_{DC}$
$V_{IN}$	Differential input voltage	32	$V_{DC}$
$V_{IN}$	Input voltage	-0.3 to +32	$V_{DC}$
$P_D$	Maximum power dissipation, $T_A=25^\circ\text{C}$ (still-air) <sup>1</sup>		
	N package	1420	mW
	F package	1190	mW
	D package	1040	mW
	Output short-circuit to GND one amplifier <sup>2</sup> $V_{CC} < 15V_{DC}$ and $T_A=25^\circ\text{C}$	Continuous	
$I_{IN}$	Input current ( $V_{IN} < -0.3V$ ) <sup>3</sup>	50	mA
$T_A$	Operating ambient temperature range		
	LM324/A	0 to +70	$^\circ\text{C}$
	LM224	-25 to +85	$^\circ\text{C}$
	SA534	-40 to +85	$^\circ\text{C}$
	LM2902	-40 to +125	$^\circ\text{C}$
	LM124	-55 to +125	$^\circ\text{C}$
$T_{STG}$	Storage temperature range	-65 to +150	$^\circ\text{C}$
$T_{SOLD}$	Lead soldering temperature (10sec max)	300	$^\circ\text{C}$

## NOTES:

- Derate above  $25^\circ\text{C}$  at the following rates:  
F package at  $9.5\text{mW}/^\circ\text{C}$   
N package at  $11.4\text{mW}/^\circ\text{C}$   
D package at  $8.3\text{mW}/^\circ\text{C}$
- Short-circuits from the output to  $V_{CC+}$  can cause excessive heating and eventual destruction. The maximum output current is approximately 40mA, independent of the magnitude of  $V_{CC}$ . At values of supply voltage in excess of  $+15V_{DC}$  continuous short-circuits can exceed the power dissipation ratings and cause eventual destruction.
- This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input bias clamps. In addition, there is also lateral NPN parasitic transistor action on the IC chip. This action can cause the output voltages of the op amps to go to the  $V+$  rail (or to ground for a large overdrive) during the time that the input is driven negative.

$V_{NOISE}$	Input noise voltage	$f=1kHz$		40		nV/ $\sqrt{Hz}$

**NOTES:**

- $V_O \approx 1.4V_{DC}$ ,  $R_S=0\Omega$  with  $V_{CC}$  from 5V to 30V and over full input common-mode range ( $0V_{DC}$  to  $V_{CC}-1.5V$ ).
- The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the input lines.
- The input common-mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is  $V_{CC}-1.5$ , but either or both inputs can go to +32V without damage.
- Short-circuits from the output to  $V_{CC}$  can cause excessive heating and eventual destruction. The maximum output current is approximately 40mA independent of the magnitude of  $V_{CC}$ . At values of supply voltage in excess of +15V<sub>DC</sub>, continuous short-circuits can exceed the power dissipation ratings and cause eventual destruction. Destructive dissipation can result from simultaneous shorts on all amplifiers.
- Due to proximity of external components, insure that coupling is not originating via stray capacitance between these external parts. This typically can be detected as this type of coupling increases at higher frequencies.
